

Access Approval Workflows

Approval workflows are built directly into the platform, eliminating the need for separate ticketing or manual processes. A unified policy engine with pre-defined rules can automatically grant access.

For requests that require extra oversight, Britive supports flexible workflows with AND/OR logic, group approvals, and manager escalation, delivered natively in the console or via tools like Slack and Teams.

Policy-Driven Approvals:

Unified policy engine assigns access based on existing organizational policy.

Built in Approval Workflows:

Approvals can be handled directly in the Britive platform, with alerts and actions pushed via Teams, Slack, email, etc.

Seamlessly Integrated with External Systems:

Automatically update approval workflows via IaC. Support ITSM and incident management use cases for access based on existing tickets.

Additional Access Approvals

Britive makes it easy to design approval workflows that don't stall when someone is unavailable, on vacation, or leaves the company. Flexible AND/OR logic ensures access requests are never bottlenecked while still meeting governance requirements.

AND logic: All designated approvers must approve the request before access is granted.

OR logic: any one approver from the list or group can approve access.

Group tags assign approval to a team or role so coverage isn't tied to a single person.

Users can get automatic approval based on presence of a ticket with criteria defined in the approval workflow.
